

CLOUD SECURITY FUNDAMENTALS FOR CANADIAN GOVERNMENT

COURSE CODE: SEC-332

COURSE DETAILS

Intrinsec's Cloud Security Fundamentals for Canadian Government training is a vendor-neutral two-day cloud security and risk management course that addresses Canadian Government cloud security and risk management documentation and cloud adoption requirements. The main benefit of having this session delivered to your employees is to raise awareness of cloud security and risk management issues surrounding cloud services and why these services need to be properly secured and how to use the available tools and standards to meet Canadian Government requirements.

This course fully addresses special aspects that Canadian Government employees and contractors must be aware of before procuring and consuming public cloud services. It is simply unrealistic to expect these individuals to understand the cyber supply chain they are building and how some provider contracts may result in loss of Intellectual Property.

COURSE BREAKDOWN

In the Cloud Security Fundamentals for Canadian Government course, students will spend a total of 2-days reviewing all six domains featured in your course material. Additional information on what you can expect to learn while reviewing each domain is found below.

DOMAIN 1 | Cloud Level-Set
